Topic: Course Enrollment Platform *(University of Puerto Rico: Mayagüez)*	Author: Kenniel Torres Laboy	Date: January 26, 2022

Problem Background

- The current course enrollment platform of the University of Puerto Rico: Mayagüez complicates the course enrollment process and intimidates new, or unfamiliarized, students.
- For more than 10 years, the platform has remained with the same approach and students seek a simpler way to enroll new courses.
- It lacks an option to temporarily store desired courses for enrollment, until the enrollment period ends.

Target

The goal to be reached by May, 2022 is to provide a course enrollment platform for the University of Puerto Rico: Mayagüez that offers a straightforward, easily navigable page for students and staff. Additionally, it will provide a feature that allows students to save courses, which will be marked as unenrolled, once offers are placed until the enrollment period ends.

Causes

- The current platform uses an outdated command line approach which is not friendly to the average user.
- It complicates the process of course selection due to having to search the courses individually instead of allowing pre-selected unenrolled courses to be enrolled from the same page.

Countermeasures

- Create an efficient and intuitive course enrollment platform.
- Adds a course pre-save feature.
- Decreases the time of selecting courses and enrolling for the following semesters.

Check/Evaluate

- It is easier to navigate and provides a more straightforward approach for everyone.
- The use of the ticket system for any complications that might arise will become less clustered.

Act/Standardize

- Other universities of the same conglomerate using the outdated system, can provide their students with an improved platform.
